Website: http://terriblytinytales.com
Android or iOS: http://terriblytinytales.com/app

Started as a Facebook page with tweet-sized fiction in March 2013, TTT now reaches millions of readers every week across social media. We also conduct flagship writing workshops in top institutions and college festivals around the country, have our own official merchandise online store (www.sttore.com) and have successfully collaborated with some of the world's biggest brands to co-create content, like Cornetto, Tinder, United Colors of Benetton, Amnesty International, Stayfree, Dell, and many more. We have also creatively produced multiple short films (see our youtube channel), some of which were hailed as the best to come out of India.

Our app is on Android and iOS app stores, and we have some ambitious plans ahead.

Applied

Job Description

Looking for a talented techie to
- join the tech team in designing the architecture and developing of a social network app
- develop backend services
- develop front end in collaboration with our UI/UX designer(s)
- work on backend technologies like nodejs, redis, mysql, mongodb, kafka, python
- work on frontend technologies like Reactjs, Angular and Ionic
- work on Scalable Algorithms and Machine Learning
- you shall directly report to our CTO

Skills Required:
- Must be strong in atleast Nodejs, Angular or Ionic Framework
- Experience in MongoDB or Kafka or ReactJS or Python a strong plus
- Experience in Machine Learning a strong plus
- Strong problem solving ability
- Strong programming skills

============
How To Apply (applicants must attempt the below challenge)
============

Design and build the following:
1. A front end which accepts a number input N with a Submit button (extra points for building frontend in Angular or React or a HTML5 framework)

2. On entering a value and pressing submit, a request should be sent to the backend (backend can be in any technology, extra points for using nodejs)

3. From the backend, fetch a file hosted at http://terriblytinytales.com/test.txt

4. From the backend, return the top N most frequently occurring words in this file (do not use a ready made module for frequency computation)

5. Display the top N words and their frequency of occurrence in the frontend, in a tabular format

Expected solution:
1. The source code of the frontend and backend to be uploaded to github along with a readme file. Please submit the github link as part of Application Note.

2. Readme must
- explain components of the code
- mention all libraries and plugins used (do not use a ready made module for frequency computation)
- list all test cases run along with test data and screenshots

3. Extra points for hosting this solution on AWS (free tier) or Heroku or somewhere online

NOTE: Applications without the submission github link (in the application Note) will not be considered.

Skills
Python, Machine Learning, MongoDB, Node.js, AngularJS, Kafka, Ionic Framework, React.js
Compensation
₹900K – ₹1500K
No Equity
